

Security in the Cloud: Why we need it

Student User

Domain: General IT

Abstract

This report talks about security and why it is very good for cloud networks. Many hackers are trying to break into servers, so we need to use DevSecOps to stop them from doing that. If we don't, we will lose money.

1 Introduction

Security is very important in the modern world. With computers everywhere, people can steal data easily. We must secure our things. DevSecOps is a new word that means doing security while doing operations and development.

2 Discussion

I think DevSecOps is a great idea. Developers should not just write code; they should also check if the code is safe. There are tools to do this. We can use tools that scan the code. If the code is bad, the tool says it is bad. Then the developer fixes it.

It is also important to use passwords. A lot of companies do not use good passwords, and that is why they get hacked. We should tell everyone to use two-factor authentication.

3 Conclusion

In conclusion, cloud security is very important and DevSecOps is the best way to handle it. Every company should buy security software.
